## I – PRÉSENTATION DE LA MISSION

### I.1 – Présentation de la mission

La Régie Parcs d'Azur a confié, à la société SOL-ESSAIS, la reconnaissance de sol et l'étude géotechnique destinées à orienter le choix des principes généraux de fondation et de soutènement de l'opération de construction d'un parking enterré dont l'édification est envisagée sur un terrain situé 13 rue de Grammont sur la commune de NICE (06).

Cette prestation a été réalisée en application de notre proposition technique et financière, référence P21-2730 du 10 décembre 2021, validée par le maître d'ouvrage en date du 27 décembre 2021.

### I.2 – Consistance de la mission de sondages

Concernant le projet, notre intervention a été basée sur :

- 3 forages destructifs, avec enregistrement continu des paramètres, descendus à 15 m de profondeur, en vue de l'exécution d'essais pressiométriques répartis dans les différentes couches traversées ;

Les forages pressiométriques ont permis d'apprécier les qualités de compacité et d'homogénéité des terrains traversés.

### I.3 – Mission selon la norme NF P 94-500

Notre intervention s'inscrit dans le cadre d'une mission de type G2 phase PRO conforme à la classification des missions géotechniques types USG (Tableau 1 de la norme NF P 94-500 du 30 Novembre 2013).

## II – RESULTATS

On trouvera en annexe :

- Les graphiques des forages destructifs D21-2216 FP301 à FP303 ainsi que les résultats d'essais pressiométriques s'y rapportant
- Un plan d'implantation des sondages D21-2216-1 sur fond de plan de masse.

Ces annexes sont indissociables du présent rapport.

Les cotes de départ des sondages ont été relevés par GPS et rattachés au NGF.

### II.1 – Sondages destructifs

Les forages destructifs ont été réalisés avec un enregistrement continu des paramètres de foration, à l'aide d'un appareil de type LIM 4000 ou APAGEO.

Sur les graphiques, on peut lire, de gauche à droite :

- **La vitesse instantanée d'avancement**, graduée de 0 à 200 m/h ; ce paramètre traduit la compacité et la cohésion des matériaux ; il permet également de déceler d'éventuels vides ou zones de frottement décomprimées ;
- **La pression du fluide d'injection**, graduée de 0 à 20 bars ; ses variations traduisent la cohésion du matériau ; son augmentation correspond souvent à un faciès argileux ou marneux ;
- **La pression sur l'outil (PO)**, graduée de 0 à 10\$0 bars, elle permet une analyse plus fine de la vitesse d'avancement ;
- **Le couple de rotation (CR)**, gradué de 0 à 100 bars ; il est également en relation avec la cohésion du matériau.

### ESSAIS PRESSIOMETRIQUES

- . La pression limite (Pl) et la pression de fluage (Pf), graduées en MPa.
- . Le module pressiométrique (Em), gradué en MPa.

## **II.2 – Campagne de sondage précédente**

Pour rappel entre 2000 et 2004, nous avons effectués plusieurs campagnes de sondages, dossier N°34196, comprenant des essais de pénétration statique lourde, des essais de pompage, des forages carottés et des essais Lefranc.

Les essais de pénétration statique lourde ont montré la présence d'une succession irrégulière de couches à dominante fine, de type limons ou limons sableux localement argileux, et de passages de granulométrie plus grossière à faciès de sables, galets et graviers dont l'importance est rapidement variable aussi bien dans le sens vertical qu'horizontal.

Ces terrains possèdent un degré de compacité médiocre et une assez forte compressibilité d'ensemble.

Les horizons à structure grossière sont par contre caractérisés par des efforts de pointe beaucoup plus élevés et par une allure de courbe irrégulière « en dent de scie » correspondant à la rencontre de matériaux de type galets et graviers.

Il convient ici de noter que ces terrains ne possèdent qu'une extension verticale et horizontale limitée.

## **II.3 – Contexte géologique**

Le terrain, concerné par le projet, est situé dans une zone où prédomine, généralement, un substratum du Keuper (Trias), constitué de marnes et gypses, surmonté d'une forte épaisseur de dépôts alluvionnaires récents.

La présence de remblais d'aménagement est possible.

Ces dispositions générales sont bien confirmées par les résultats des sondages effectués sur le terrain.

## II.4 – Synthèse géotechnique

La synthèse des résultats des investigations géotechniques réalisées permet de dégager schématiquement les formations suivantes :

- Sol n°1 : Remblais et limons de couverture

Des remblais et dépôts alluvionnaires, de type limons ou limons sableux localement argileux ont d'abord été mis en évidence sur des épaisseurs variables mais généralement assez importantes.

En effet, les essais pressiométriques effectués traversent une succession irrégulière de couches à dominante fine ainsi qu'en témoignent les valeurs localement très faibles qui y sont mesurés.

Epaisseur suivant sondages :

| Sondage                 | F301      | F302      | F303      |
|-------------------------|-----------|-----------|-----------|
| Epaisseur sol 1         | 9.5m      | 9.0m      | 10.0m     |
| Base de la couche sol 1 | 17.50 NGF | 18.00 NGF | 17.00 NGF |

Les graphiques des forages destructifs mettent en évidence des vitesses d'avancement assez hétérogènes mais globalement assez élevés, comprise entre 250 m/h et 500 m/h, témoignant d'une compacité médiocre et d'une assez forte compressibilité d'ensemble.

Les essais pressiométriques, réalisés dans les sondages destructifs, ont permis de retenir les caractéristiques pressiométriques moyennes suivantes :

- Pression limite (Pl) : 0.4 MPa
- Module pressiométrique (Em) : 8 MPa

## SOL-ESSAIS

- Sol n°2 : Alluvions à dominante grossière

On note en profondeur, sur des épaisseurs limités, des horizons à structure grossière caractérisés par des pressions limites plus élevés, mettant en évidence un sol de meilleure compacité.

Profondeur suivant sondages :

| Sondage                 | F301      | F302      | F303      |
|-------------------------|-----------|-----------|-----------|
| Epaisseur sol 2         | 1.5m      | 2.0m      | 1.0m      |
| Base de la couche sol 2 | 16.00 NGF | 16.00 NGF | 16.00 NGF |

Les graphiques des forages destructifs mettent en évidence des vitesses d'avancement un peu plus faibles, comprise entre 10 et 50 m/h, dans les passages caillouteux, témoignant d'une compacité moyenne localement.

Les essais pressiométriques, réalisés dans les sondages destructifs, ont permis de retenir les caractéristiques pressiométriques moyennes suivantes :

- Pression limite (Pl) : 2.0 MPa
- Module pressiométrique (Em) : 20 MPa.

Il convient ici de noter que ces terrains ne possèdent qu'une extension verticale et horizontale limitée avec une disposition aléatoire.

- Sol n°3 : Alluvions à structure fine à dominante limono-argileuse localement sableuse

Sous les alluvions à dominante grossière, on retrouve en profondeur, sur des épaisseurs importantes, des horizons à structure dominante fine ainsi qu'en témoignent les valeurs de pressions limites localement très faibles qui y sont mesurés.

Les graphiques des forages destructifs mettent en évidence des vitesses d'avancement assez hétérogènes mais globalement assez élevés, de l'ordre de 250 m/h maximum témoignant d'une compacité médiocre et d'une assez forte compressibilité d'ensemble.

## SOL-ESSAIS

Les essais pressiométriques, réalisés dans les sondages destructifs, ont permis de retenir les caractéristiques pressiométriques moyennes suivantes :

- Pression limite (Pl) : 0.5 MPa
- Module pressiométrique (Em) : 8 MPa.

### II.5 – Niveau d'eau

Des niveaux d'eaux, non parfaitement stabilisés, ont pu être relevé en fin de campagne de sondage :

- Vers 2.45 m de profondeur en FP301, soit + 24.65 NGF ;
- Vers 2.45 m de profondeur en FP302, soit + 24.65 NGF ;
- Vers 2.45 m de profondeur en FP303, soit + 24.75 NGF.

Même si ces niveaux ne sont pas parfaitement stabilisés, ils traduisent cependant un gradiant d'écoulement de la nappe éventuellement perturbé par la prédominance, au droit de certains sondages, de matériaux à structure grossière plus perméable par l'intermédiaire desquels s'effectuent des circulations d'eau privilégiées.

Des fluctuations saisonnières du toit de la nappe peuvent également être constatées et seul un suivi régulier du niveau piézométrique permettra d'apprécier l'importance de ces variations.

Il est également possible que des circulations d'eau souterraines en charge se produisent au sein de couches granulométriques grossières intercalées entre deux passages limoneux moins perméables, ce qui explique la présence dans ce secteur de puits pouvant même posséder un léger artésianisme.

Les niveaux d'eau que l'on pourra retenir sont les suivants :

- Eau Basse / Eau Chantier      EC = EB = +25.00 NGF
- Eau Haute                          EH = +26.50 NGF
- Eau Exceptionnelle              EE = +27.50 NGF

## III – ETUDE DE PROJET

### III.1 – Introduction

Le projet prévoit la construction d'un parking enterré en R-3 sans superstructure.

L'adaptation au sol du projet, comporte des terrassements de déblais de l'ordre de 11.5 m de profondeur environ.

La cote finie du dernier sous-sol du parking a été fixée entre +18.45 NGF, côté de l'église Sainte Jeanne d'Arc, et +17.70 NGF côté de la rue Michel-Ange, en fonction des éléments de coupes qui nous ont été transmis.

Les soutènements envisagés sont de type paroi moulée butonnée comportant une forte inertie compte tenu de la présence de matériaux.

Les fondations s'orienteront vers un choix de fondations superficielles de type radier très épais et/ou nervuré.

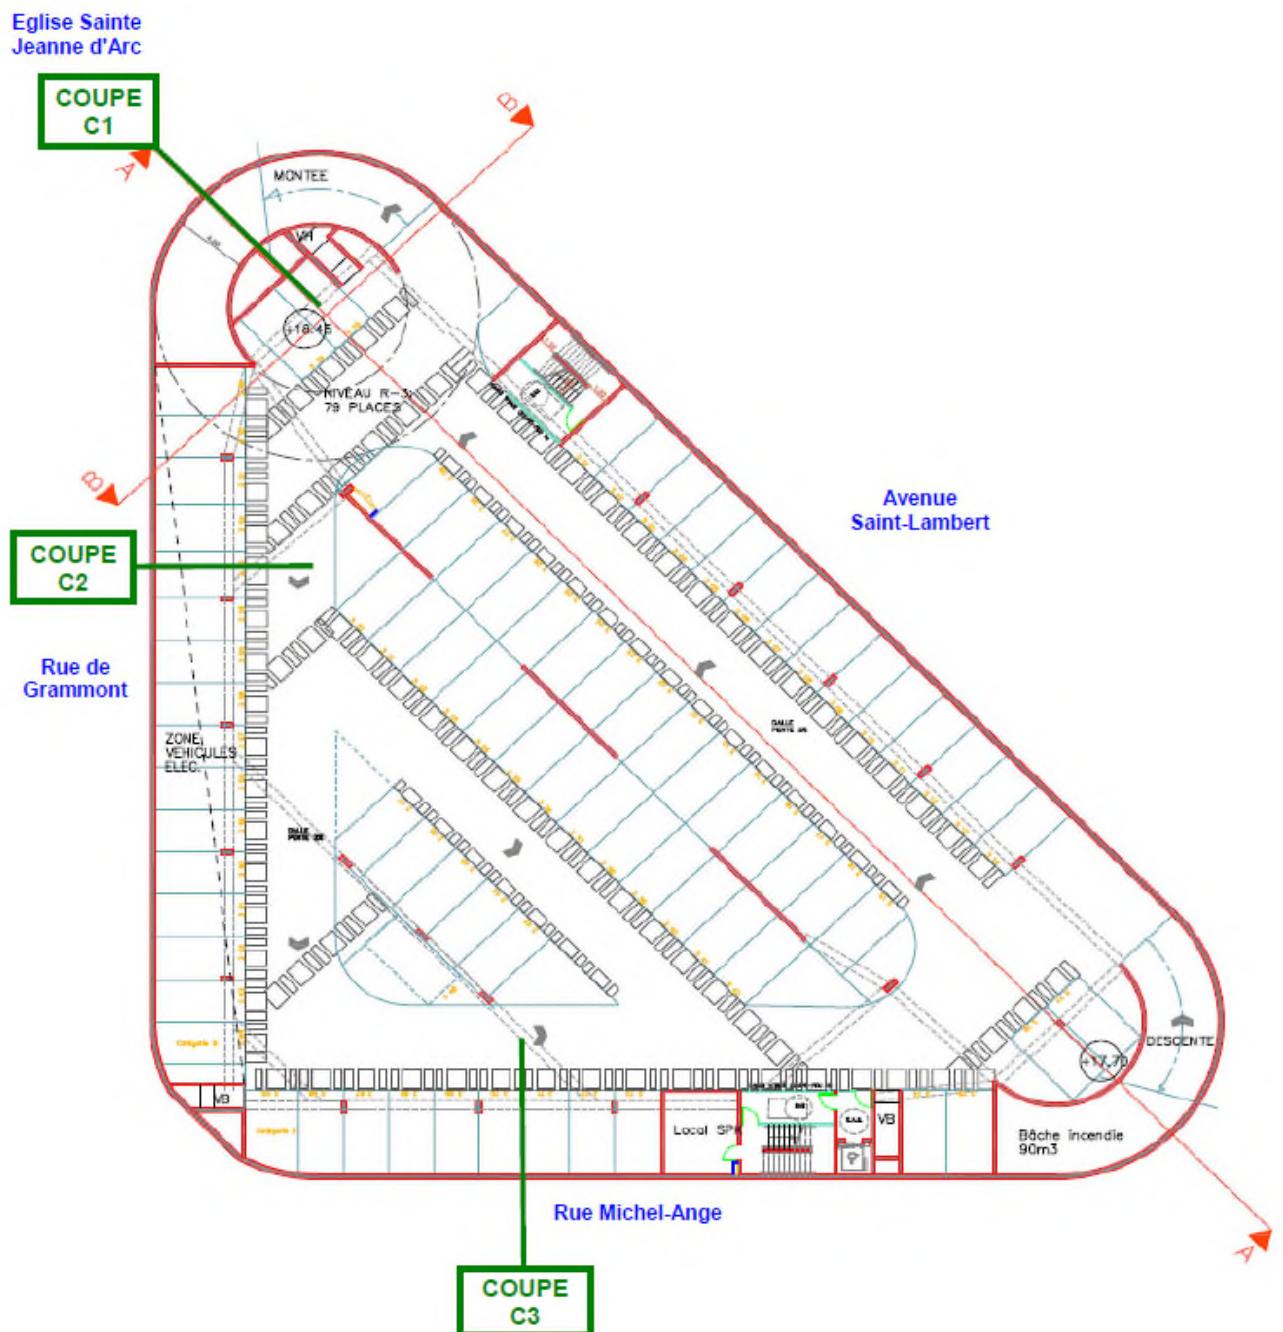

Notre étude est limitée au prédimensionnement des dispositifs de confortement à mettre en œuvre pour sécuriser les soutènements nécessaires à la construction du parking.

Trois profils représentatifs ont été étudiés :

- **Coupe 1 (côté Eglise Sainte Jeanne d'Arc)**  
la mise en œuvre d'une paroi moulée avec 4 niveaux de butons préchargés sur une hauteur de 11.5m.
- **Coupe 2 (côté Rue de Grammont et R+3)**  
la mise en œuvre d'une paroi moulée avec 4 niveaux de butons préchargés sur une hauteur de 11.5m.
- **Coupe 3 (côté Rue Michel Ange et R+5)**  
la mise en œuvre d'une paroi moulée avec 4 niveaux de butons préchargés sur une hauteur de 11.4m.

## SOL-ESSAIS

L'implantation des profils étudiés est la suivante :

## III.2 – Hypothèses géotechniques

- Valeurs caractéristiques**

Les valeurs caractéristiques des paramètres géomécaniques retenues dans les calculs sont présentées ci-après :

| Paramètres géotechniques      | Sol 1<br>Remblais et limons de couverture |        | Sol 2<br>Alluvions à dominante grossière |        | Sol 3<br>Alluvions à structure fine à dominante limono-argileuse localement sableuse |        |
|-------------------------------|---|--------|--|--------|--|--------|
| Durée                         | Courte                                    | Longue | Courte                                   | Longue | Courte   | Longue |
| $\gamma$ (kN/m <sup>3</sup> ) | 18  |        | 20                                       |        | 19   |        |
| $\phi$ (°)                    | 20  | 30     | 32                                       | 35     | 21   | 30     |
| c (kPa)                       | 10  | 0      | 5  | 0      | 15   | 0      |
| Coefficient de poussée        | 1/3                                       | 1/3    | 1/3                                      | 1/3    | 1/3  | 1/3    |
| Coefficient de butée          | -2/3                                      | -2/3   | -2/3                                     | -2/3   | -2/3   | -2/3   |
| Frottement latéral Qsl (kPa)  | 60  |        |  |        |  |        |
| Em (Mpa)                      | 6.0                                       |        | 20.0                                     |        | 8.0  |        |
| pl (Mpa)                      | 0.4                                       |        | 2.0                                      |        | 0.5  |        |
| $\alpha$                      | 0.50                                      |        | 0.33                                     |        | 0.50   |        |

Les modules de réaction horizontale ont été évalués avec la méthode de Schmitt en utilisant les résultats des essais pressiométriques disponibles.

L'inclinaison des contraintes en poussées et butées sur les soutènements sont les suivantes :

- en poussée                       $\delta/\phi = 0$  dans la couche fine et peu compacte  
 $\delta/\phi = 1/3$  dans les horizons de granulométrie plus grossière et de meilleure résistance
- en butée                         $\delta/\phi = -1/3$  dans la couche fine et peu compacte  
 $\delta/\phi = -2/3$  dans les horizons de granulométrie plus grossière et de meilleure résistance

Les calculs ont été effectués en application de la norme NF P 94-282 avec prise en compte d'un modèle terrain, et correspondent à des vérifications de stabilité GEO et HYD.

- **Documents de référence**

La liste des normes et des documents de référence est la suivante :

- NF EN 1997
- NF P 94-282
- NF P 94-270
- NF P 94-262
- NF EN 1998 (Eurocodes 8).

## III.3 – Surcharges

Les surcharges prises en compte dans les calculs en amont des parois sont de l'ordre de :

- Coupe 1 : Voirie à 20 kPa puis église à 100kPa à 16m de distance,
- Coupe 2 : Voirie à 20 kPa puis bâtiment R+3 à 60kPa à 13m de distance,
- Coupe 3 : Voirie à 20 kPa puis bâtiment R+5 à 90kPa à 9m de distance.

Il conviendra de faire valider ces hypothèses par les BET Structure en phase EXE.

## III.4 – Géométrie des ouvrages

La géométrie des ouvrages et la coupe technique retenue au droit des parois sont présentées en annexe du présent rapport.

## III.5 – Caractéristiques des butons

Les appuis seront constitués de butons tubulaires en métal avec une nuance d'acier E36.

Ils seront calculés à l'aide des efforts présentés dans les calculs RIDO à l'ELS.

Les efforts sont donnés par ml de paroi, perpendiculairement à celle-ci et devront être adaptés aux espacements et à l'inclinaison des butons/bracons prévus.

## SOL-ESSAIS

En l'absence d'informations précises sur les dispositifs de butonnages qui seront mis en œuvre et sur la raideur de l'ossature du bâtiment en phase définitive, nous avons retenu les hypothèses suivantes :

- |  |                 |
|--|-----------------|
| - Rigidité des butons métalliques provisoires                          | K = 5000T.m/ml  |
| - Raideur du radier de fondation                                       | K = 40000T.m/ml |
| - Raideur des éléments d'infrastructure de type plancher en béton armé | K = 10000T.m/ml |

Ces valeurs devront être précisées et validées par les bureaux d'études structure de l'opération.

### III.6 – Caractéristiques de la paroi moulée

La paroi moulée possèdera une épaisseur de 82cm pour toutes les zones et sa résistance à la compression simple à 28 jours sera au moins égale à 30 MPa.

Les parois travaillent en flexion composée en phase provisoire de terrassement, définitive, plus haute eau et sismique.

Dans le cadre de la modélisation effectuée, les calculs de déformées ont pris en compte les valeurs de modules de béton suivantes :

- |   |                          |
|---|--------------------------|
| - module du béton à court terme             | E = $2.2 \cdot 10^5$ MPa |
| - module du béton à long terme              | E = $1.1 \cdot 10^5$ MPa |
| - module du béton à court terme sous séisme | E = $3.3 \cdot 10^5$ MPa |

Les calculs bétons armés des parois ne font pas partie de notre mission.

### III.7 – Hydraulique

Les calculs ont été effectués en prenant en compte un niveau moyen de la nappe vers +25.00 NGF, majoré à +26.50 NGF en phase Hautes Eaux et à +27.50 NGF en phase Eaux Exceptionnelles.

Ces données, résultant de l'analyse hydrogéologique de la zone, pourront être utilement précisées par un contrôle piézométrique sur une période représentative.

Il pourra également être utilement tenu compte d'un gradient général d'écoulement mis en évidence par les investigations initiales et pouvant être localement accentué par l'effet d'obstruction à l'écoulement de la nappe que constitue l'écran en paroi moulée.

### III.8 – Pompage

La réalisation d'une enceinte périphérique, étanche, permettra de procéder au pompage de la nappe phréatique (cf §IV.6 pour l'évaluation du débit d'exhaure).

Un test de pompage préalable sera donc mené afin de vérifier l'efficacité de la continuité de l'enceinte et l'absence de rabattement intempestif à l'extérieur de la fouille.

Le rabattement localisé et temporaire de la nappe à l'intérieur de la paroi moulée devra s'effectuer avec précaution et au moyen d'un développement progressif des puits convenablement dimensionnés et régulièrement répartis, avec contrôle de l'absence de modification de volume des terrains fins.

Un contrôle du débit de pompage et de sa régularité devra être prévu au moyen de débitmètres, complété par une vérification de l'absence d'entraînement de fines par la mise en œuvre de bacs de décantation. Enfin, une vérification de l'absence de rabattement de nappe à l'extérieur de l'enceinte en paroi moulée devra être prévue notamment au moyen de tubes piézométriques faisant l'objet d'un suivi régulier.

Enfin, l'importance de l'opération conduira à la création d'un effet de barrage s'opposant à l'écoulement de la nappe, notamment latéralement, dont il conviendra d'examiner, au préalable, l'incidence dans sa zone d'influence.

En phase de service, l'ensemble des parties enterrées du projet devra être dimensionné pour tenir compte d'une sous-pression hydrostatique.

Des analyses d'eau devront être menées sur la nappe phréatique afin de vérifier son agressivité, en vue de procéder au choix des ciments entrant dans la composition des bétons et des coulis, mais également vis-à-vis des éventuelles armatures métalliques d'ancrage qui pourraient être solidarisées au terrain en phase définitive.

Les parties enterrées du projet, situées sous la nappe phréatique, seront protégées par un cuvelage général étanche.

## III.9 – Séisme

En application de l'Eurocode 8 (norme NF EN 1998-5), et du décret d'application du 22 octobre 2010, il a été pris en considération les caractéristiques suivantes :

|   |  |
|---|--|
| - Zone de sismicité                         | 4 (modéré)                                       |
| - Accélération du sol de référence          | $a_{gr}$ 1,6 m/s <sup>2</sup>                    |
| - Bâtiment de classe d'importance           | II (coefficient $\gamma = 1$ )                   |
| - Sol de catégorie                          | D (coefficient S = 1,6)                          |
| - Coefficient d'amplification topographique | $\tau = 1$                                       |
| - Type d'ouvrage                            | mur d'infrastructure enterré (coefficient r = 1) |
| - Accélération de calcul                    | $a_{max} = 2,56$ m/s <sup>2</sup>                |

A partir de ces données, il est possible d'évaluer les efforts de poussées au moyen des coefficients sismiques suivants :

- $\sigma_H = 0,261$
- $\sigma_V = \pm 0,130$

Dans ces conditions, et pour un angle de frottement interne moyen de 20°, le coefficient de poussée dynamique  $K_d$  atteint 1,04.

Nous proposons ensuite d'utiliser, dans les calculs RIDO, la méthode de MONONOBE OKABE, conduisant à tenir compte d'un chargement sensiblement rectangulaire à l'arrière du soutènement sur la hauteur excavée, en phase définitive.

Nous proposons donc ici d'introduire dans le calcul un chargement triangulaire correspondant à la différence entre le coefficient de poussée dynamique  $K_d$ , évalué ci-dessus, et le coefficient de poussée statique  $K_a$ , qui sera pris égal à 0,49 pour la couche concernée.

Le chargement triangulaire sera ensuite appliqué avec la base en tête du soutènement et les surcharges préexistantes seront majorées de 13%.

Les matériaux seront pris en compte avec leurs caractéristiques de cisaillement à court terme.

## IV – RESULTATS DES CALCULS DE SOUTENEMENTS

L'on trouvera en annexe la note technique NC01 indice 0 comprenant :

- le schéma de principe,
- les résultats des calculs élastoplastiques RIDO,
- les sollicitations dans la paroi et les butons.

### IV.1 – Méthode de calcul en déformations (RIDO)

Les profils font l'objet de calculs élastoplastiques effectués à l'aide du logiciel RIDO.

Ces calculs permettent d'évaluer les sollicitations sur les ouvrages de soutènement en parois moulées, aussi bien en phase provisoire d'excavation, avec mise en place à l'avancement de systèmes de butonnage provisoire, qu'en phase définitive, y compris sous sollicitations exceptionnelles de type eau exceptionnelle et de type sismiques en application de la norme NF EN 1998-5.

Par ailleurs, une vérification de stabilité hydraulique des parois moulées a été menée selon la méthode de Mandel (vérification de stabilité des fonds de fouilles au regard du Renard solide et de la Boulance).

Les différentes justifications fournies correspondent à l'application de la norme NF P 94-282, notamment en ce qui concerne la méthode utilisée ainsi que pour les coefficients de sécurité applicables aux différents paramètres pris en compte.

### IV.2 – Résultats Coupe 1 – Paroi moulée

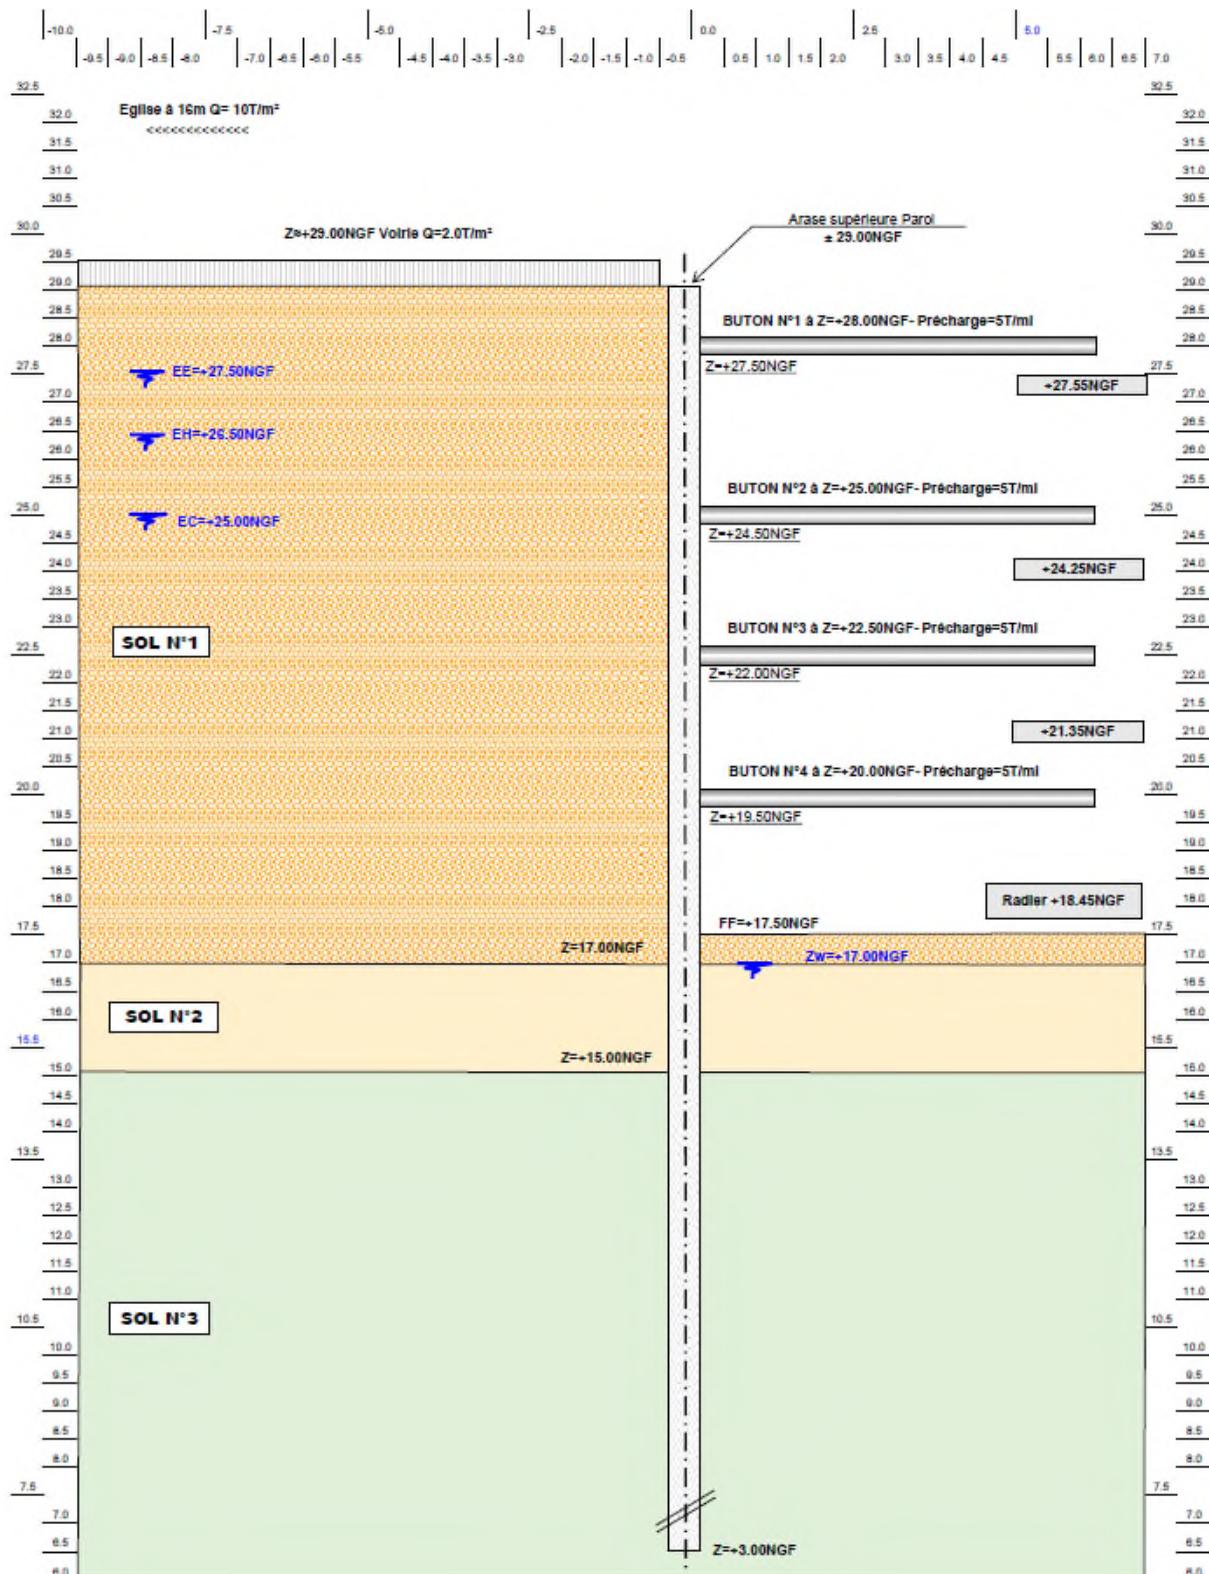

#### IV.2.1 - Profils de calcul

La paroi moulée présentera une épaisseur de 82cm, avec une arase supérieure de l'ouvrage vers la cote +29.00 NGF.

Elle présentera 4 lignes de butons préchargés à 5T.

La cote moyenne du fond de fouille, prise en compte dans les calculs, a été fixée à +17.50 NGF.

# SOL-ESSAIS

Les cotes de niveau seront à confirmer dans le cadre des études d'exécution, notamment en fonction de la géométrie des aménagements existants à proximité de la zone de travaux.

Ces données pourront être utilement précisées dans le cadre des études d'exécution, en fonction du choix définitif d'implantation par exemple.

## *IV.2.2 - Terrassements*

Les calculs RIDO effectués tiennent compte de la mise en place des dispositifs de butonnages internes à l'avancement des terrassements de déblais ce qui impose un enchaînement progressif et constant de ces différents tâches.

De même, l'enlèvement des dispositifs de butonnages internes ne peut s'effectuer qu'au fur et à mesure de la mise en place des éléments de reprise progressive des efforts de poussées par les ouvrages de type plancher et voile d'infrastructure.

Il est donc nécessaire de prévoir, à l'avancement des terrassements, une excavation par plots de dimensions limitées et alternés, avec mise en œuvre des dispositifs de butonnages internes, y compris vérinage, et, d'autre part, la reprise progressive des efforts de poussées par les éléments d'infrastructure de blocage définitif, tels que radier et plancher notamment, avant enlèvement des butons internes.

## *IV.2.3 - Calculs RIDO*

Les déformées, les moments fléchissants maxi se développant dans les parois ainsi que les sollicitations dans le système de butonnage, sont récapitulés dans les tableaux du document annexé au présent rapport.

## *IV.2.4 - Phasage de réalisation*

La méthode de réalisation des travaux a été déterminée de manière à obtenir des déformées compatibles avec l'environnement du chantier.

Le phasage, pris en compte dans les calculs, correspond donc, dans tous les cas, à une excavation progressive après réalisation de la paroi moulée, avec mise en place, à l'avancement et par plots alternés de dimensions limitées, de systèmes de butonnage.

Le principe général de phasage, retenu pour la réalisation des travaux, est donc le suivant :

- Initialisation des contraintes,
- Réalisation des murettes guides
- Réalisation de la paroi moulée, épaisseur 82cm, depuis le terrain actuel soit +29.00NGF,
- Excavation de la première passe de terrassement, jusqu'à une profondeur de 0,50 m sous le premier niveau de butons, soit +27.50NGF
- Mise en œuvre des butons à la cote +28.00NGF,
- Excavation à la cote +24.50NGF
- Mise en œuvre des butons à la cote +25.00NGF,
- Excavation à la cote +22.00NGF
- Mise en œuvre des butons à la cote +22.50NGF,
- Excavation à la cote +19.50NGF
- Mise en œuvre des butons à la cote +20.00NGF,
- Excavation jusqu'au fond de fouille à +17.50NGF,
- Fin de la phase provisoire,
- Mise en place des planchers et phase de débutonnage progressif,
- Caractéristiques des sols à long terme et Fluage du béton,
- Phase d'Eaux Exceptionnelles,
- Phase séisme EC8.

## IV.3 – Résultats Coupe 2 – Paroi moulée

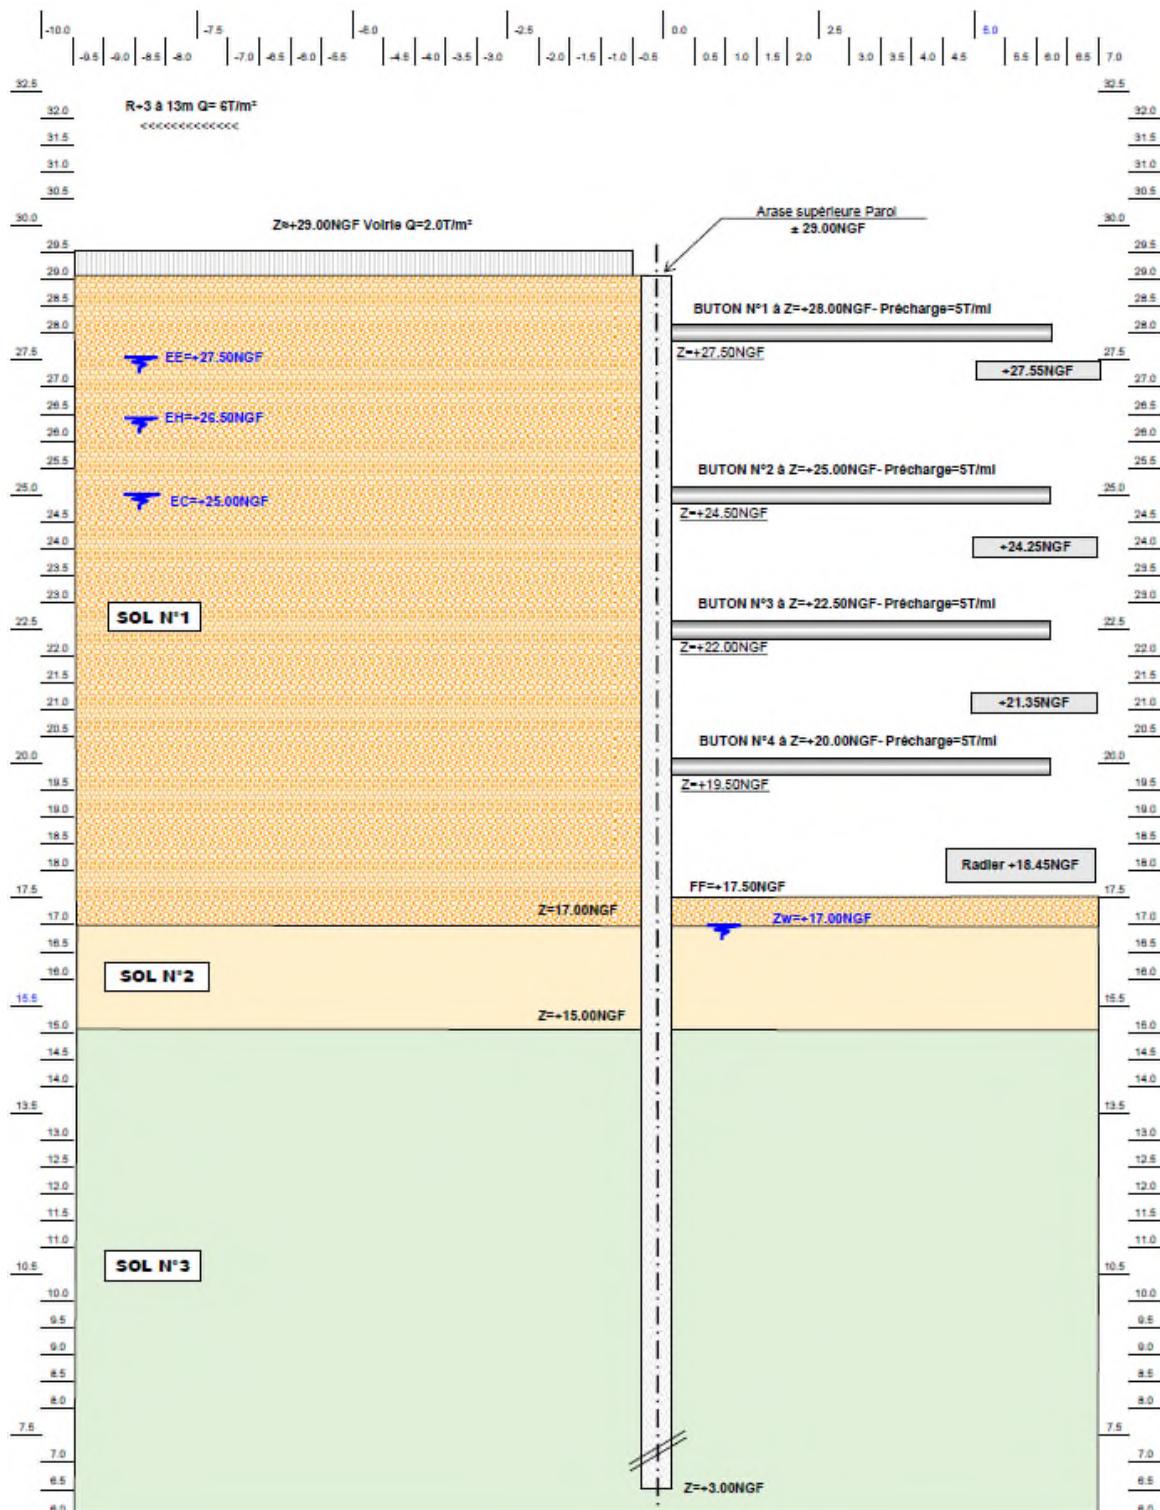

### IV.3.1 - Profils de calcul

La paroi moulée présentera une épaisseur de 82cm, avec une arase supérieure de l'ouvrage vers la cote +29.00 NGF.

Elle présentera 4 lignes de butons préchargés à 5T.

La cote moyenne du fond de fouille, prise en compte dans les calculs, a été fixée à +17.50 NGF.

# SOL-ESSAIS

Les cotes de niveau seront à confirmer dans le cadre des études d'exécution, notamment en fonction de la géométrie des aménagements existants à proximité de la zone de travaux.

Ces données pourront être utilement précisées dans le cadre des études d'exécution, en fonction du choix définitif d'implantation par exemple.

### *IV.3.2 - Terrassements*

Les calculs RIDO effectués tiennent compte de la mise en place des dispositifs de butonnages internes à l'avancement des terrassements de déblais ce qui impose un enchaînement progressif et constant de ces différentes tâches.

De même, l'enlèvement des dispositifs de butonnages internes ne peut s'effectuer qu'au fur et à mesure de la mise en place des éléments de reprise progressive des efforts de poussées par les ouvrages de type plancher et voile d'infrastructure.

Il est donc nécessaire de prévoir, à l'avancement des terrassements, une excavation par plots de dimensions limitées et alternés, avec mise en œuvre des dispositifs de butonnages internes, y compris vérinage, et, d'autre part, la reprise progressive des efforts de poussées par les éléments d'infrastructure de blocage définitif, tels que radier et plancher notamment, avant enlèvement des butons internes.

### *IV.3.3 - Calculs RIDO*

Les déformées, les moments fléchissants maxi se développant dans les parois ainsi que les sollicitations dans le système de butonnage, sont récapitulés dans les tableaux du document annexé au présent rapport.

### *IV.3.4 - Phasage de réalisation*

La méthode de réalisation des travaux a été déterminée de manière à obtenir des déformées compatibles avec l'environnement du chantier.

Le phasage, pris en compte dans les calculs, correspond donc, dans tous les cas, à une excavation progressive après réalisation de la paroi moulée, avec mise en place, à l'avancement et par plots alternés de dimensions limitées, de systèmes de butonnage.

Le principe général de phasage, retenu pour la réalisation des travaux, est donc le suivant :

- Initialisation des contraintes,
- Réalisation des murettes guides
- Réalisation de la paroi moulée, épaisseur 82cm, depuis le terrain actuel soit +29.00NGF,
- Excavation de la première passe de terrassement, jusqu'à une profondeur de 0,50 m sous le premier niveau de butons, soit +27.50NGF
- Mise en œuvre des butons à la cote +28.00NGF,
- Excavation à la cote +24.50NGF
- Mise en œuvre des butons à la cote +25.00NGF,
- Excavation à la cote +22.00NGF
- Mise en œuvre des butons à la cote +22.50NGF,
- Excavation à la cote +19.50NGF
- Mise en œuvre des butons à la cote +20.00NGF,
- Excavation jusqu'au fond de fouille à +17.50NGF,
- Fin de la phase provisoire,
- Mise en place des planchers et phase de débutonnage progressif,
- Caractéristiques des sols à long terme et Fluage du béton,
- Phase d'Eaux Exceptionnelles,
- Phase séisme EC8.

## IV.4 – Résultats Coupe 3 – Paroi moulée

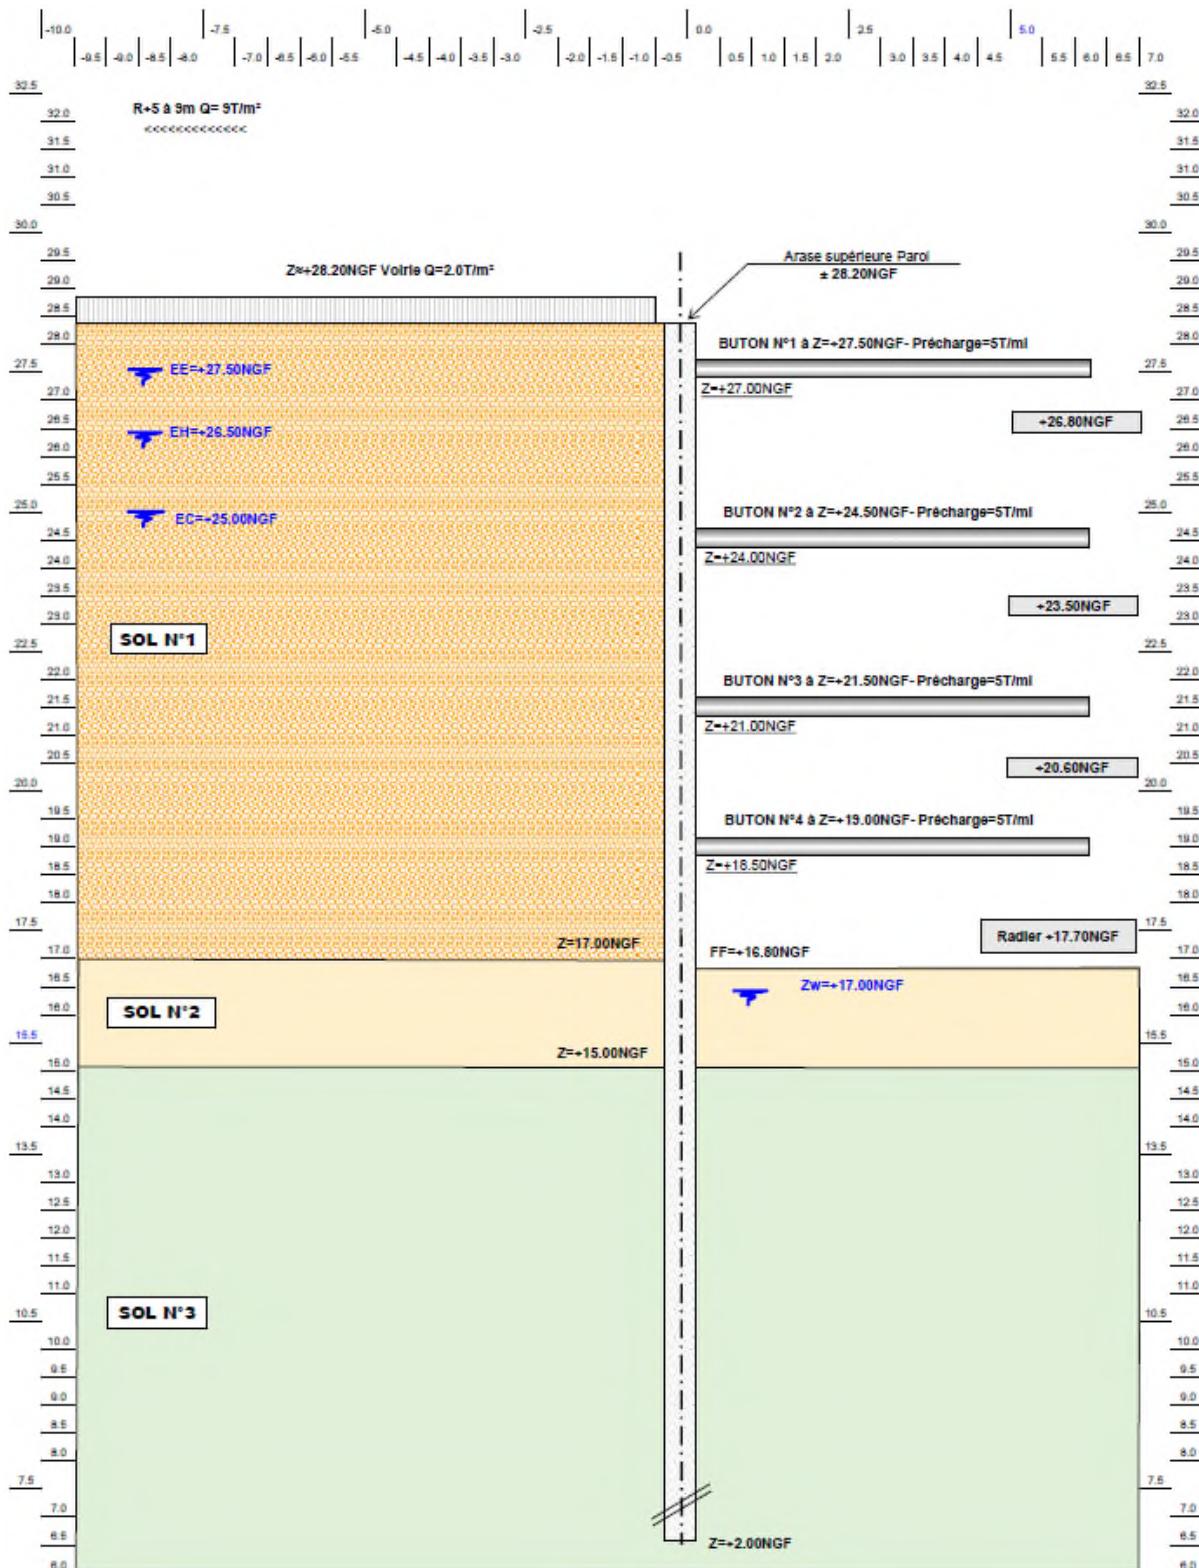

### IV.4.1 - Profils de calcul

La paroi moulée présentera une épaisseur de 82cm, avec une arase supérieure de l'ouvrage vers la cote +28.20 NGF.

Elle présentera 4 lignes de butons préchargés à 5T.

La cote moyenne du fond de fouille, prise en compte dans les calculs, a été fixée à +16.80 NGF.

SOL-ESSAIS

Les cotes de niveau seront à confirmer dans le cadre des études d'exécution, notamment en fonction de la géométrie des aménagements existants à proximité de la zone de travaux.

Ces données pourront être utilement précisées dans le cadre des études d'exécution, en fonction du choix définitif d'implantation par exemple.

### *IV.4.2 - Terrassements*

Les calculs RIDO effectués tiennent compte de la mise en place des dispositifs de butonnages internes à l'avancement des terrassements de déblais ce qui impose un enchaînement progressif et constant de ces différentes tâches.

De même, l'enlèvement des dispositifs de butonnages internes ne peut s'effectuer qu'au fur et à mesure de la mise en place des éléments de reprise progressive des efforts de poussées par les ouvrages de type plancher et voile d'infrastructure.

Il est donc nécessaire de prévoir, à l'avancement des terrassements, une excavation par plots de dimensions limitées et alternés, avec mise en œuvre des dispositifs de butonnages internes, y compris vérinage, et, d'autre part, la reprise progressive des efforts de poussées par les éléments d'infrastructure de blocage définitif, tels que radier et plancher notamment, avant enlèvement des butons internes.

### *IV.4.3 - Calculs RIDO*

Les déformées, les moments fléchissants maxi se développant dans les parois ainsi que les sollicitations dans le système de butonnage, sont récapitulés dans les tableaux du document annexé au présent rapport.

### *IV.4.4 - Phasage de réalisation*

La méthode de réalisation des travaux a été déterminée de manière à obtenir des déformées compatibles avec l'environnement du chantier.

Le phasage, pris en compte dans les calculs, correspond donc, dans tous les cas, à une excavation progressive après réalisation de la paroi moulée, avec mise en place, à l'avancement et par plots alternés de dimensions limitées, de systèmes de butonnage.

Le principe général de phasage, retenu pour la réalisation des travaux, est donc le suivant :

- Initialisation des contraintes,
- Réalisation des murettes guides
- Réalisation de la paroi moulée, épaisseur 82cm, depuis le terrain actuel soit +28.20NGF,
- Excavation de la première passe de terrassement, jusqu'à une profondeur de 0,50 m sous le premier niveau de butons, soit +27.00NGF
- Mise en œuvre des butons à la cote +27.50NGF,
- Excavation à la cote +24.00NGF
- Mise en œuvre des butons à la cote +24.50NGF,
- Excavation à la cote +21.00NGF
- Mise en œuvre des butons à la cote +21.50NGF,
- Excavation à la cote +18.50NGF
- Mise en œuvre des butons à la cote +19.00NGF,
- Excavation jusqu'au fond de fouille à +16.80NGF,
- Fin de la phase provisoire,
- Mise en place des planchers et phase de débutonnage progressif,
- Caractéristiques des sols à long terme et Fluage du béton,
- Phase d'Eaux Exceptionnelles,
- Phase séisme EC8.

### IV.5 – Vérification de la paroi en butée

Les résultats des calculs élastoplastiques RIDO montrent que les coefficients de sécurité de la paroi en butée mécanique sont toujours supérieurs à 1,5 en phase provisoire, conformément à la norme NF P 94-282.

Ces particularités conduisent à augmenter, de manière significative la fiche des parois moulées.

## IV.6 – Vérification hydraulique

### IV.6.1 – Stabilité hydraulique

Les vérifications hydrauliques suivantes ont été effectuées :

- Vérification du Renard solide,
- Vérification de la Boulance type I et II,
- Vérification de la Boulance type III.

Les parois apparaissent stables aux vues des résultats des coefficients de sécurité.

### IV.6.2 – Evaluation du débit d'exhaure

Une estimation du débit d'exhaure de la fouille a été évaluée selon 2 méthodes :

- Une Formulation simple (Formule de Dupuits),
- La Méthode de Davidenkoff.

Pour une perméabilité en masse assez faible évaluée à  $3.7 \times 10^{-6}$  m/s (voir les résultats de l'essai de pompage), le débit évalué, selon les conditions de calcul des parois moulées, se situe entre 13 m<sup>3</sup>/h et 28 m<sup>3</sup>/h.

Ces débits annoncés tiennent compte d'un terrain très peu perméable et plutôt homogène.

Nous rappellerons cependant que la vérification de stabilité, effectuée sur un plan hydraulique, ne préjuge pas des résultats qui seront obtenus en termes de débit de pompage, notamment dans ce type de terrain où les dépôts alluvionnaires présentent une structure lenticulaire affectée, au moins localement, de variations rapides de faciès et de granulométrie pouvant ainsi conduire, notamment dans le cas de terrains particulièrement grossiers, à des débits de pompage importants.

Les essais ont montré la présence d'une succession irrégulière de couches à dominante fine, de type limons ou limons sableux localement argileux, et de passages de granulométrie plus grossière à faciès de sables, galets et graviers dont l'épaisseur et la position sont rapidement variables aussi bien dans le sens vertical qu'horizontal.

Compte tenu de ces éléments, les parois moulées devront recouper les lentilles de granulométrie grossières horizontales, conférant une barrière hydraulique aux écoulements hydrauliques importants.

Toutefois, ces lentilles grossière peuvent présenter des connexions verticales entre elles, pouvant apporter des débits d'eau importants en fond de fouille.

Nous considérons que ce risque est avéré, et que cela entraînerait des débits au moins 10 fois supérieures à ceux estimés, soit environ 250 m<sup>3</sup>/h.

Aussi et dans ces conditions, l'on constate que la stabilité hydraulique du fond de fouille au regard d'une analyse de Boulangue de type III, présente un coefficient de sécurité proche de l'acceptable.

Seule la réalisation d'un bouchon injecté permettrait de maîtriser les débits en phase chantier, d'un point de vue capacité de rejet dans les ouvrages de collecte existants, ainsi que vis-à-vis des autorisations administratives et environnementales.

### *IV.6.3 – Recommandations*

L'abaissement du niveau de la nappe en phase travaux nécessitera l'installation d'un dispositif de pompage, constitué de puits et pointes filtrantes régulièrement répartis sous l'emprise du projet, potentiellement complétés par des dispositifs d'assainissement spécifiques en vue d'améliorer l'écoulement des eaux dans les horizons fins et peu perméables et permettre une meilleure praticabilité des fonds de fouille au fur et à mesure de l'avancement des excavations.

Une vérification de l'absence de modifications notables du volume des sols fins, lors des travaux de pompage, devra également être effectuée dès le début de ce type de travaux, notamment par une auscultation inclinométrique de précision.

Le contrôle de l'absence d'influence défavorable de la paroi moulée sur l'écoulement de la nappe, notamment par effet d'obstruction, devra également être prévu dans le cadre d'une modélisation hydrogéologique spécifique (hors mission SOL ESSAIS).

## V – RESULTATS DES CALCULS DE FONDATIONS

L'on trouvera en annexe la note technique NC01 indice 0 comprenant :

- les résultats des calculs de capacité portante des micropieux de fondations en traction,
- les résultats des calculs de capacité portante des barrettes de fondations en traction.

### V.1 – Principes généraux

Les terrassements sont prévus à la cote +17.50NGF côté Eglise Sainte Jeanne d'Arc et à la cote +16.80NGF côté Rue Michel Ange.

A cette profondeur, il apparaît que les matériaux recoupés présenteront essentiellement un faciès à structure fine à dominante limono-argileuse localement sableuse.

Les niveaux d'eau étant élevés et le parking relativement « léger », il y aura essentiellement des efforts de soulèvement à la sous-pression à prendre en compte dans les calculs.

Nous avons donc effectué un calcul permettant d'évaluer la capacité portante en traction des micropieux et barrettes de fondations de 10ml de profondeur.

Des échanges techniques sont en cours avec le BET OTEIS pour préciser les éléments de reprises des sous-pression.

## VI – RESULTATS DES ESSAIS DE POMPAGE

## VI.1 – Principes généraux

Notre intervention a comporté la réalisation d'un essai de pompage dans le puits noté PT, complétés par 3 forages équipés de tubes piézométriques rayonnants, notés PZ1 à PZ3.

La numérotation des puits et piézomètre correspond aux sondages suivants :

- ✓ Puits PT Sondage FP301
  - ✓ Piézomètre PZ1 Sondage FP303
  - ✓ Piézomètre PZ2 Sondage FP302
  - ✓ Piézomètre PZ3 Sondage F202.

L'essai de pompage a été réalisé sur une période de 72H, avec contrôle continu de l'évolution des niveaux d'eau souterrain dans les puits et piézomètres associés, en vue de l'évaluation des débits d'exhaure nécessaires au rabattement localisé et temporaire de la nappe lors de la réalisation des travaux d'infrastructure du projet.

Notre mission a ensuite comporté le dépouillement des résultats et leur interprétation pour une évaluation de la perméabilité en masse des terrains.

## VI.2 – Résultats de l'essai de pompage

L'essai de pompage a été réalisé au droit du puits par l'installation d'une pompe immergée dont la mise en service (début de l'essai de pompage) est intervenue le 02 février 2022 à 08h40, pour un arrêt de pompage le 05 février 2022 à 10H20 (durée approximative du pompage 72H).

Durant cette période, le débit de pompage moyen est de l'ordre de  $9.16 \text{ m}^3/\text{h}$ .

Le niveau moyen de la nappe se situait, au démarrage de l'essai de pompage, vers +24.2 NGF au droit du puits PT pour des niveaux sensiblement équivalents dans les piézomètres associés (+24.3 NGF au droit du PZ1, +24.2 NGF au droit du PZ2 et +25.2 NGF au droit du PZ3).

En fin d'essai de pompage, les niveaux moyens de la nappe se situaient respectivement vers :

- +19.4 NGF au droit du puits PT ;
- +21.3 NGF au droit du PZ1 ;
- +20.5 NGF au droit du PZ2 ;
- +24.0 NGF au droit du PZ3.

Pour le débit de pompage de  $9.16 \text{ m}^3/\text{h}$ , il apparaît donc que l'abaissement moyen de la nappe est de l'ordre de 4.9 m au droit du puits 1, objet du pompage, et de l'ordre de 1.2 m au droit du PZ3.

Ces différents résultats sont détaillés dans les tableaux de mesures de suivi piézométriques, annexés à la présente note.

On trouvera également, en annexe à celle-ci, les courbes d'évolution des niveaux piézométriques dans le puits PT et dans les piézomètres associés, permettant de constater, d'une part, la stabilité du niveau piézométrique dans le puits de pompage, validant ainsi un régime d'écoulement permanent lors de l'essai, et l'influence limitée du pompage au niveau des piézomètres voisins.

L'exploitation des courbes de rabattement du niveau d'eau dans les piézomètres a pu être réalisée selon la méthode de COOPERJACOB permettant ainsi d'évaluer la transmissivité des terrains testés qui atteint, dans le cas présent :

- ✓  $T = 6.87 \cdot 10^{-5} \text{ m}^2/\text{s}$  au niveau du PZ1
- ✓  $T = 7.40 \cdot 10^{-5} \text{ m}^2/\text{s}$  au niveau du PZ2.

En retenant une épaisseur moyenne de la nappe dans la zone d'intervention de l'ordre de 20 m, on obtient une perméabilité moyenne des terrains testés au droit du puits PT atteignant :

- ✓  $K = 3.43 \cdot 10^{-6} \text{ m}^2/\text{s}$  au niveau du PZ1
- ✓  $K = 3.70 \cdot 10^{-6} \text{ m}^2/\text{s}$  au niveau du PZ2.

### **VI.3 – Conclusions**

Cet essai de pompage permet une approche plus ou moins globale de la perméabilité d'ensemble des terrains en place.

Les différentes caractéristiques de perméabilité évoquées ci-dessus pourront donc être utilement prises en compte pour l'évaluation du débit de pompage nécessaire au rabattement localisé et temporaire de la nappe lors de la réalisation des travaux d'infrastructure, notamment en cas de remontée significative du niveau moyen de la nappe, à la suite d'intempéries soutenues par exemple.

Cette évaluation devra également tenir compte du caractère particulièrement anisotrope du paramètre perméabilité et des variations rapides de faciès et de granulométrie des terrains alluvionnaires sous-jacents.

## VII – OBSERVATIONS GENERALES

Au stade de la mission G2-PRO, pour la création du parking, il est prévu sur toute la périphérie de la fouille, la mise en œuvre d'une paroi moulée provisoire avec 4 niveaux de butons préchargés sur une hauteur de 11.4m à 11.5m.

Les calculs d'exécution, qui seront menés dans le cadre d'une mission de type G3, permettront d'affiner le dimensionnement actuellement réalisé, notamment en fonction de données précises de chantier.

La mission G3 suivi devra également analyser et fournir des avis sur les documents de suivi de l'entreprise.

Les techniques, utilisées pour la confection des parois, devront être adaptées au contexte géotechnique particulier de la zone d'intervention, caractérisée par des épaisseurs très importantes de dépôts alluvionnaires hétérogènes et de granulométrie rapidement variable, nécessitant notamment un contrôle systématique de continuité de bétonnage des panneaux de paroi au moyen d'essais soniques par exemple.

Nous attirons également l'attention sur la présence possible de matériaux de granulométrie très grossière (galets crus), pouvant conduire à des surconsommations de boue bentonitique.

Les travaux de perforation et de bétonnage doivent également rester compatibles avec l'environnement urbain sensible du chantier.

Les valeurs de frottement latéral ( $q_s$ ) devront impérativement être validées par l'intermédiaire d'essais de traction préalables poussés à la rupture en ce qui concerne les micropieux.

Les forages des barrettes et des micropieux devront, en outre, être considérés comme des reconnaissances de sol complémentaires à l'avancement dont les résultats seront transmis sous forme de fiches détaillées au fur et à mesure à la maîtrise d'œuvre technique.

## SOL-ESSAIS

En présence d'anomalies ou de variations de faciès, des adaptations du projet initial pourront alors s'avérer nécessaires.

Dans cet esprit, une auscultation du comportement des ouvrages de soutènement, conformément à la Méthode Observationnelle décrite à l'Eurocode 7, devra être prévue en phase provisoire de terrassement, notamment au moyen d'un suivi topographique de précision des parois et des avoisinants, associé à un contrôle inclinométrique des parois et de la zone située en amont, ainsi que de cellules de charges dans les butons, et d'extensofors.

Une vérification de l'évolution des efforts, pouvant se développer au niveau des systèmes de butonnages internes, paraît également nécessaire.

En cas d'anomalies, le projet devra être adapté.

Le rabattement localisé et temporaire de la nappe à l'intérieur de la paroi moulée s'effectuera avec précautions et selon un développement progressif des puits convenablement dimensionnés et régulièrement répartis avec vérification de l'absence de modification de volume des terrains, complétée par le contrôle de l'évolution éventuelle du débit de pompage par débitmètre et par une vérification de l'absence d'entraînement de fines par la mise en place de bacs de décantation régulièrement contrôlés.

L'auscultation, permettant de s'assurer de l'absence de rabattement de nappe à l'extérieur de la paroi moulée, devra également être prévue au moyen de tubes piézométriques permettant également de vérifier qu'il n'existe pas de remontée importante de la nappe sous l'effet de l'obstruction éventuelle de l'écoulement de celle-ci, après mise en œuvre des éléments de paroi moulée.

## SOL-ESSAIS

Nous rappelons que les préconisations et ouvrages proposés dans le présent rapport, ont été définis dans le cadre d'une mission de conception de type G2 PRO visant à définir de manière précise le projet.

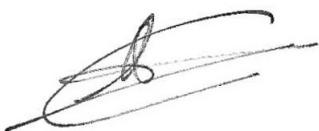

L'enchaînement des missions géotechniques, selon la norme NF P 94-500, devra être respecté.

La mission géotechnique d'exécution G3 sera réalisée à la charge de l'entreprise titulaire des travaux.

En outre, la catégorie d'importance de l'ouvrage, vis-à-vis des Eurocodes 8 sismiques, en accord avec le maître d'ouvrage, sera définie.

En aucun cas le présent rapport ne pourra être utilisé comme document d'exécution.

Biot, le 08 avril 2022

Laetitia EHRHARDT DUMAITRE

## VIII – ANNEXES

- Les graphiques des forages destructifs D21-2321 FP301 à FP303 ainsi que les résultats d'essais pressiométriques s'y rapportant
- Un plan d'implantation des sondages D21-2321-4 sur fond de plan de masse
- Les résultats des essais de pompage
- Une note de calcul de stabilité NC01 indice 0 comprenant :
  - Synthèse des caractéristiques géomécaniques retenues pour les calculs,
  - Pour les 3 coupes d'étude (C1, C2 et C3) de parois moulées :
    - une coupe type sur l'ouvrage intégrant les données géométriques de l'excavation, les caractéristiques stratigraphiques des terrains prises en compte ainsi que la géométrie et les surcharges correspondant aux aménagements voisins ;
    - une fiche EXCEL de justification des efforts de poussée, pris en compte sous sollicitations sismiques Eurocode 8 ;
    - un tableau de synthèse des sollicitations et déformations des écrans de soutènement selon les phases de calcul ;
    - une fiche EXCEL de justification de la portance des parois moulées ;
    - les justifications de stabilité hydraulique ;
    - une évaluation du débit d'exhaure de la fouille ;
  - Pour les fondations :
    - une évaluation de la capacité portante des micropieux et barrettes de fondations en traction
  - Ensemble des résultats des calculs RIDO en efforts/déformations.

## Calcul de la Transmissivité T

$$\Delta S = 6,79 \text{ m}$$

$$Q = 9,16 \text{ m}^3 / \text{h}$$

$$T = 0,183 * Q / \Delta S$$

$$T = 6,87E-05 \text{ m}^2/\text{s}$$

## Calcul du coefficient d'emmagasinement S

$$\text{Distance } a = 8,2 \text{ m}$$

$$t_0 = 3416,4 \text{ s}$$

$$S = 2,25 * T * t_0 / r^2$$

$$S = 6,44E-02$$

## Calcul de la perméabilité K

$$\text{Epaisseur de la nappe} = 20 \text{ m}$$

$$K = T / b \text{ en m/s}$$

$$K = 3,43E-06 \text{ m/s}$$

( 4 IT.)

RAPPORT (REACTION EFFECTIVE)/(REACTION PASSIVE) POUR LE SOL 1 = 0.117 = (229.14 T/m)/(1957.70 T/m) SANS INTERET  
RAPPORT (REACTION EFFECTIVE)/(REACTION PASSIVE) POUR LE SOL 2 = 0.691 = (272.70 T/m)/(394.71 T/m)

EFFET HORIZONTAL CUMULE DES SURCHARGES SUR LE SOL 1 = 94.66 T/m

INCOHERENCE POUR DES SURCHARGES DE POUSSEE ACTIVE

ATTENTION 72.56 % de la zone d'application du modèle n'est pas en état de poussée active

ATTENTION superposition entre les niveaux 24.25 m et 10.43 m

EFFET HORIZONTAL CUMULE DES SURCHARGES SUR LE SOL 2 = 0.00 T/m

\*\*\* CALCUL TERMINE
